

Status report - Thursday

Timeline for Bachelor Studies

Maurice Donner David Schledewitz

September 10th, 2020

- Starting to work together with Bogdan and Pascal on the ALPIDE Telescope.
- Main Operation of the Telescope
- What is a Threshold Scan?

- Plotting first results of threshold scans

- Later that month: Automising the procedure and plotting the first Threshold "Heatmaps"

April

- Also finishing the First Google Document
- Looking at first Noiseoccupancy Scans

- Deciding to take Cosmic data due to the COVID-19 restrictions
- Finishing the second Google Document

- Cosmics yield huge filesizes. Starting to work on a program that handles them...
- Meanwhile keep taking as much data as possible, and documenting the process in another Google Document

DATE	TIME	LOCATION	MEASUREMENT	UNIT	STATUS	REMARKS

2020-05-01	13:00:00	1000m	1000	1000	OK	Initial test run

- Looking especially at Muon rates, chip effectiveness and making first calculations about angular distributions

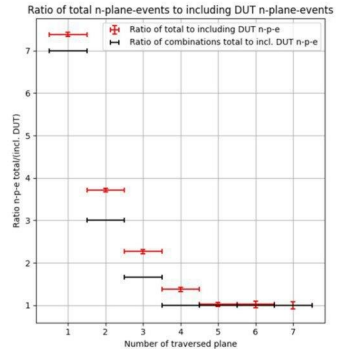

- Finishing the compression program, and taking first looks at the cosmic data as a whole

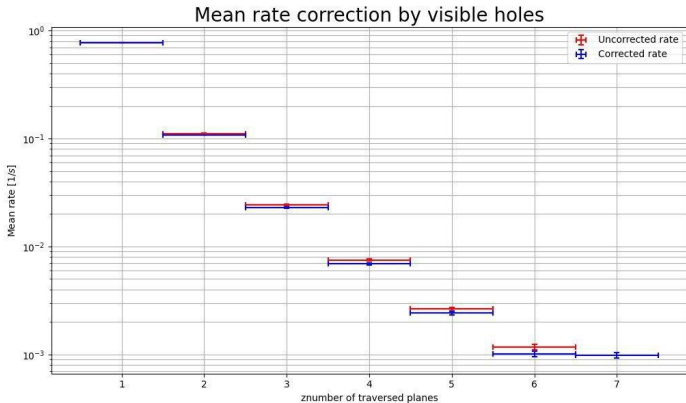

- Starting to work on a tracking algorithm, since the **data per run** is too small for corryvreckan to calculate any tracks

- Fixing muonrate calculations and looking at overestimation

- Fixing muonrate calculations and looking at overestimation

- Finishing Event organization and first align attempts (First with Testbeam Data)

- Meanwhile visualizing the first Cosmics

- Finished Tracking algorithm and comparing alignment to DESY-Testbeam Data

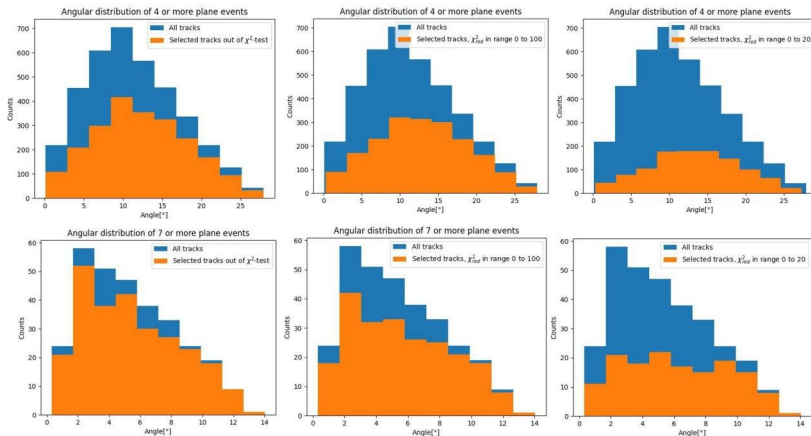

- Found out, that transporting the telescope changes the alignment by up to 1.7mm.
- Looking at χ^2 and identifying further alignment issues

Only little hits on Plane 0 and 1

- **Testbeam time!! :D**
- Plotting angular distribution for different χ^2 .

- Why doesn't this Distribution agree with the model?

August

- **Testbeam time!! :D**
- Plotting angular distribution for different χ^2 .

- Why doesn't this Distribution agree with the model?

Open Questions

- Where do these weird patterns come from?
- How to align with angular data (currently investigated)
- Why are some of the planes only 85% efficient?
